FCE_CRC_1

FCE CRC calculation

AURIX™ TC2xx Microcontroller Training
V1.0.0

Please read the Important Notice and Warnings at the end of this document

Scope of work

The FCE module is used to calculate the CRC of the same message with different algorithms.

This training shows how to configure the FCE to calculate CRC of a known message with all supported algorithms (CRC32, CRC16 and CRC8).
The FCE interrupt is enabled to report execution errors.
Any CRC kernel calculation error is indicated by switching ON the related LED.

Introduction

- The Flexible CRC Engine (FCE) provides a parallel implementation of Cyclic Redundancy Code (CRC) algorithms.

- FCE module supported algorithms:
  - IEEE 802.3 Ethernet CRC32 polynomial
  - CCITT CRC16 polynomial
  - SAE J1850 CRC8 polynomial

- CRC algorithms are used to calculate message signatures that can be used to check message integrity during transport over communication.

Hardware setup

This code example has been developed for the board KIT_AURIX_TC297_TFT_BC-Step.

Implementation

Demo Initialization

The initialization of the module is done via ***Fce_Crc_Init()***, which contains:

- the FCE module initialization, using the function ***IfxFce_Crc_initModule()***
- the CRC algorithms initialization, using the function ***IfxFce_Crc_initCrc()***

Demo execution

The execution is started with the function ***Fce_Crc_Demo_Run()***, which calculates:

- CRC32 algorithm, using ***IfxFce_Crc_calculateCrc32()***
- CRC16 algorithm, using ***IfxFce_Crc_calculateCrc16()***
- CRC8 algorithm, using ***IfxFce_Crc_calculateCrc8()***

All functions, needed for using the FCE CRC calculation, are provided by the iLLD header ***IfxFce_Crc.h***.

FCE Error Interrupt Service Routine

The ISR will be executed in case of a CRC calculation error. It will scan all kernels status registers and check if error flags are set.

Implementation

Configure and control the LEDs

Four LEDs are configured to be switched on/off by the **controlling port pins** to which they are connected using methods from the iLLD header ***IfxPort.h***.

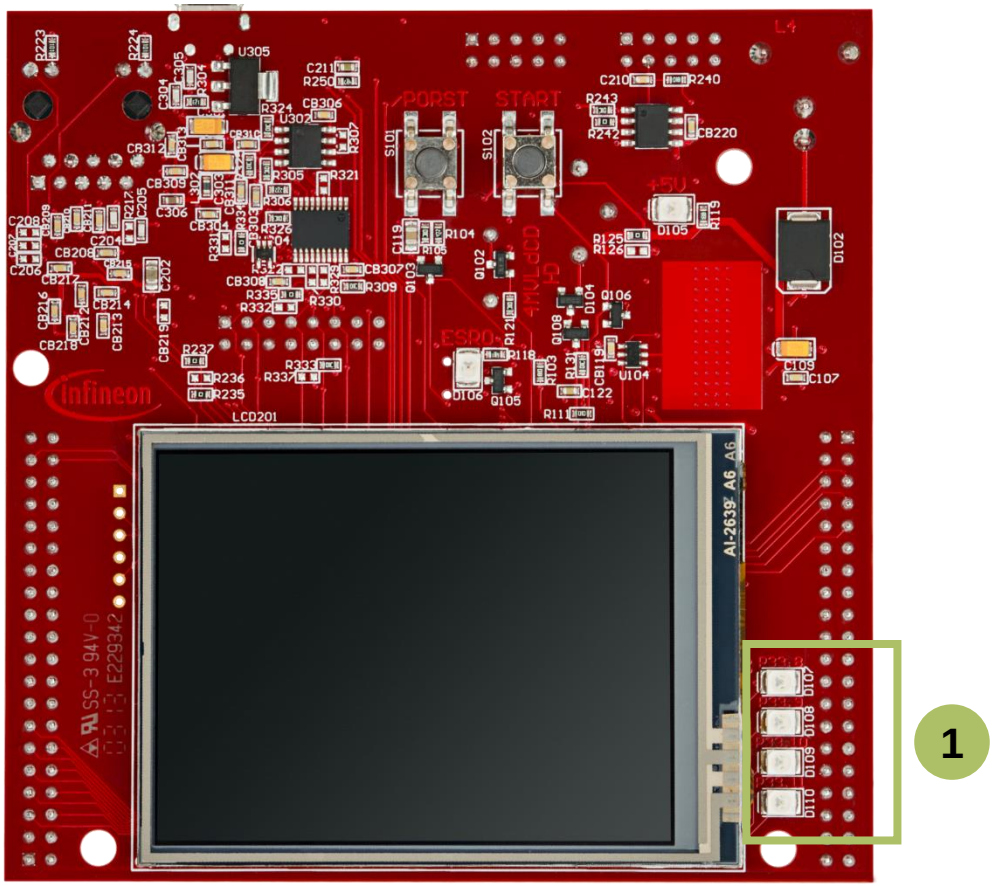
In the setup phase, the port pins of the LEDs have to be **configured as push-pull output** using the function ***IfxPort_setPinMode()***.

If CRC calculation errors occur, the related LEDs are **switched on** using the function ***IfxPort_setPinLow()***.

Copyright © Infineon Technologies AG 2019. All rights reserved.

Run and Test

After code compilation and flashing the device, observe the LEDs' behavior. All LEDs (1) should be switched **Off** if all CRC algorithms calculation are correct (Result = Expected)



Copyright © Infineon Technologies AG 2019. All rights reserved.

Run and Test

- LEDs behavior in case of Error:
  - CRC32 Kernel 0 calculation error: **D107** switches On
    - Could be tested by setting the macro ***CRC32_KERNEL0_WRONG_CHECK_VAL*** to 1
  - CRC32 Kernel 1 calculation error: **D108** switches On
    - Could be tested by setting the macro ***CRC32_KERNEL1_WRONG_CHECK_VAL*** to 1
  - CRC16 calculation error: **D109** switches On
    - Could be tested by setting the macro ***CRC16_WRONG_CHECK_VAL*** to 1
  - CRC8 calculation error: **D110** switches On
    - Could be tested by setting the macro ***CRC8_WRONG_CHECK_VAL*** to 1

- All macros mentioned above are provided only for test purpose. They allow to pass a wrong expected value to the FCE CRC kernel which leads to a mismatch with the calculated one, therefore the error flag will be set and the error interrupt will be triggered.
