

RIF

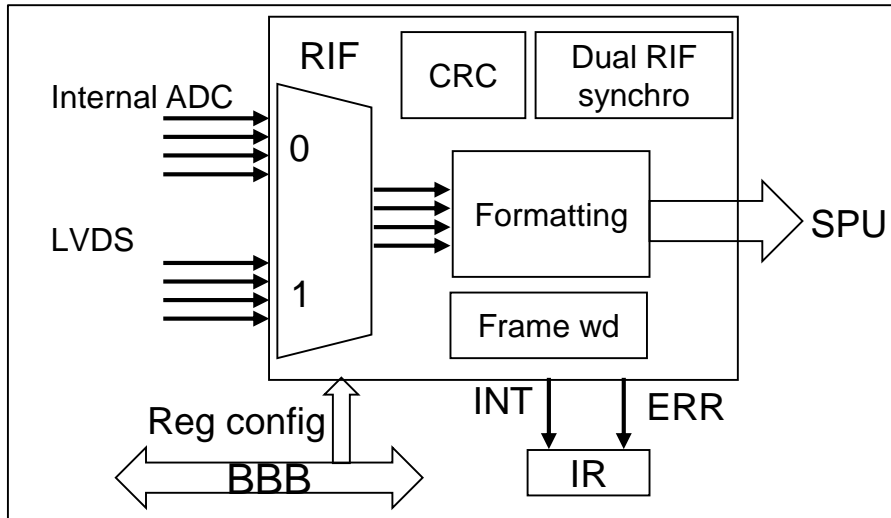

Radar interface

AURIX™ TC3xx Microcontroller Training
V1.0 2020-06

RIF

Radar Interface

Highlights

- > The RIF is responsible for the interface between the Radar ADC (Internal or External) and an SPU module
- > The RIF handles formatting the incoming data so it matches the SPU RIF input format
- > The RIF can assert a safe communication with external ADC and SPU

Key Features

Input selection

Data formatting

Safety features

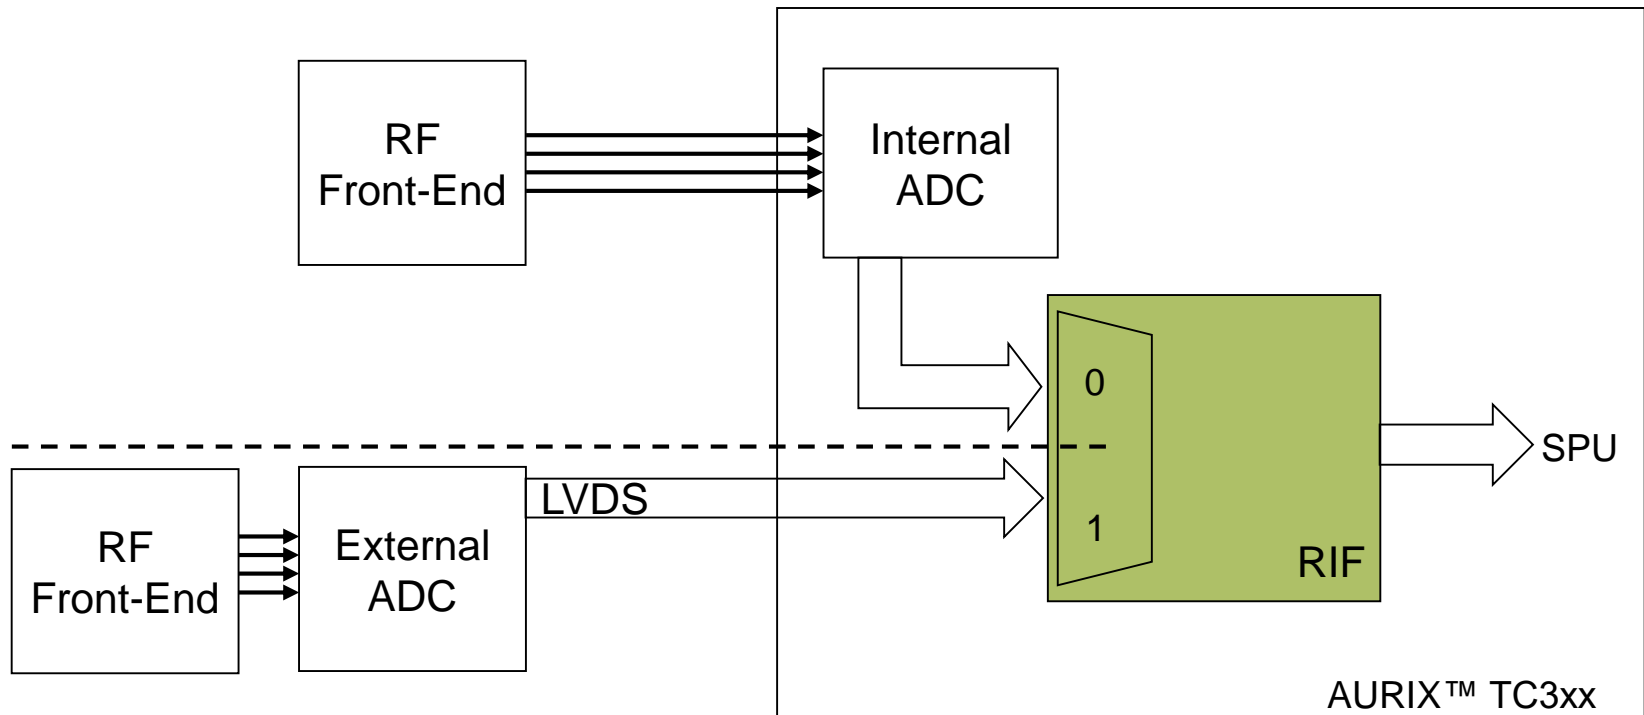

Customer Benefits

- > Compatibility with many MMIC and not only Infineon products
- > Wide range of data formats can be used
- > Enabling ASIL-B radar processing

RIF

Input selection

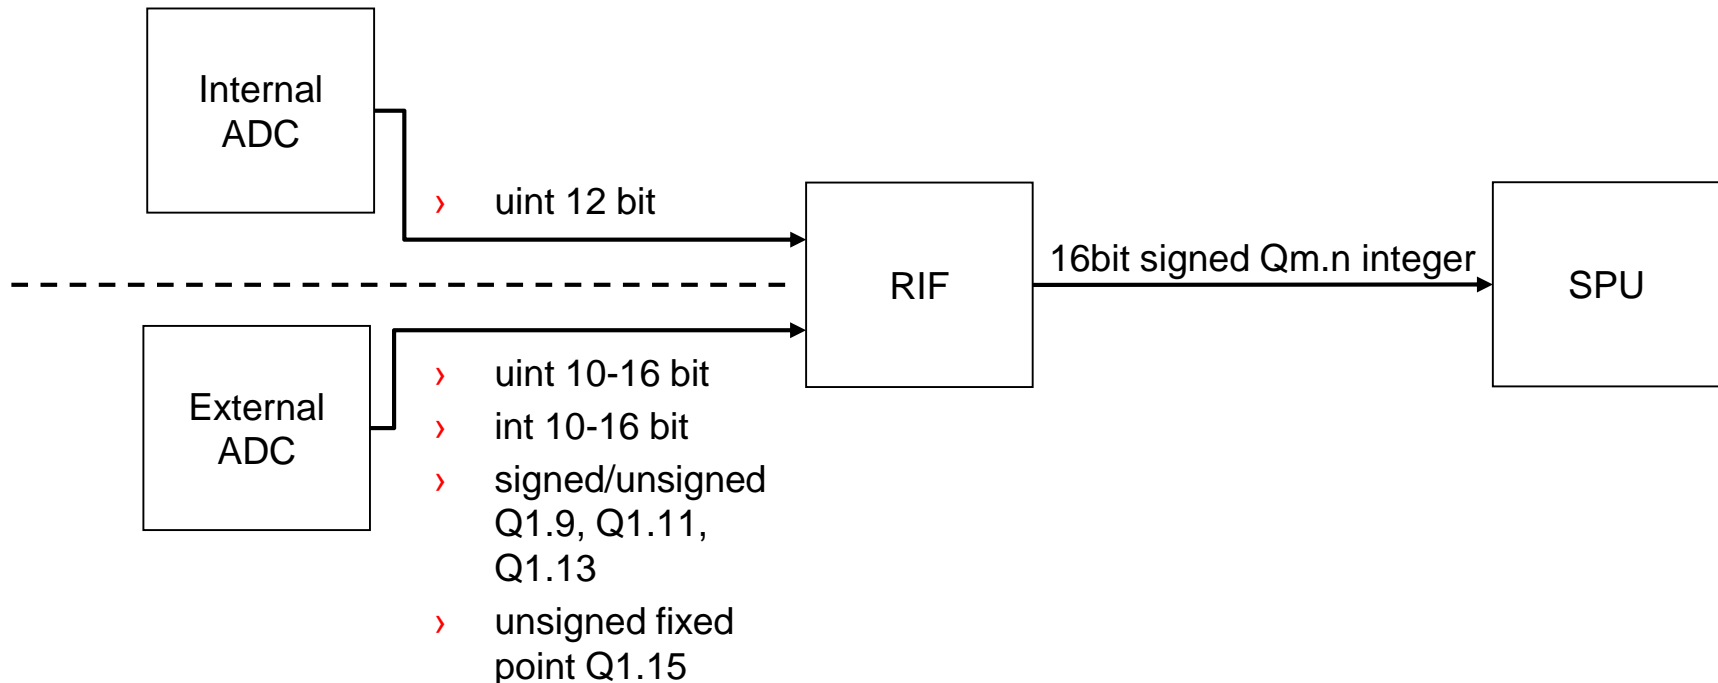

- › The RIF can retrieve the data from up to 4 channels
- › The data can come either from internal ADC **or** external ADC via LVDS lines

RIF

Data formatting

- › SPU expects 16bit signed Qm.n integers as an input from the RIF, which are delivered to the SPU in 32bit packet
- › On the other hand, the RIF accepts a wider range of formats and is responsible for adjusting the direction (lsb/msb), data length (16 bits) and format of the incoming ADC data so it fits the SPU RIF input format

RIF

Safety features

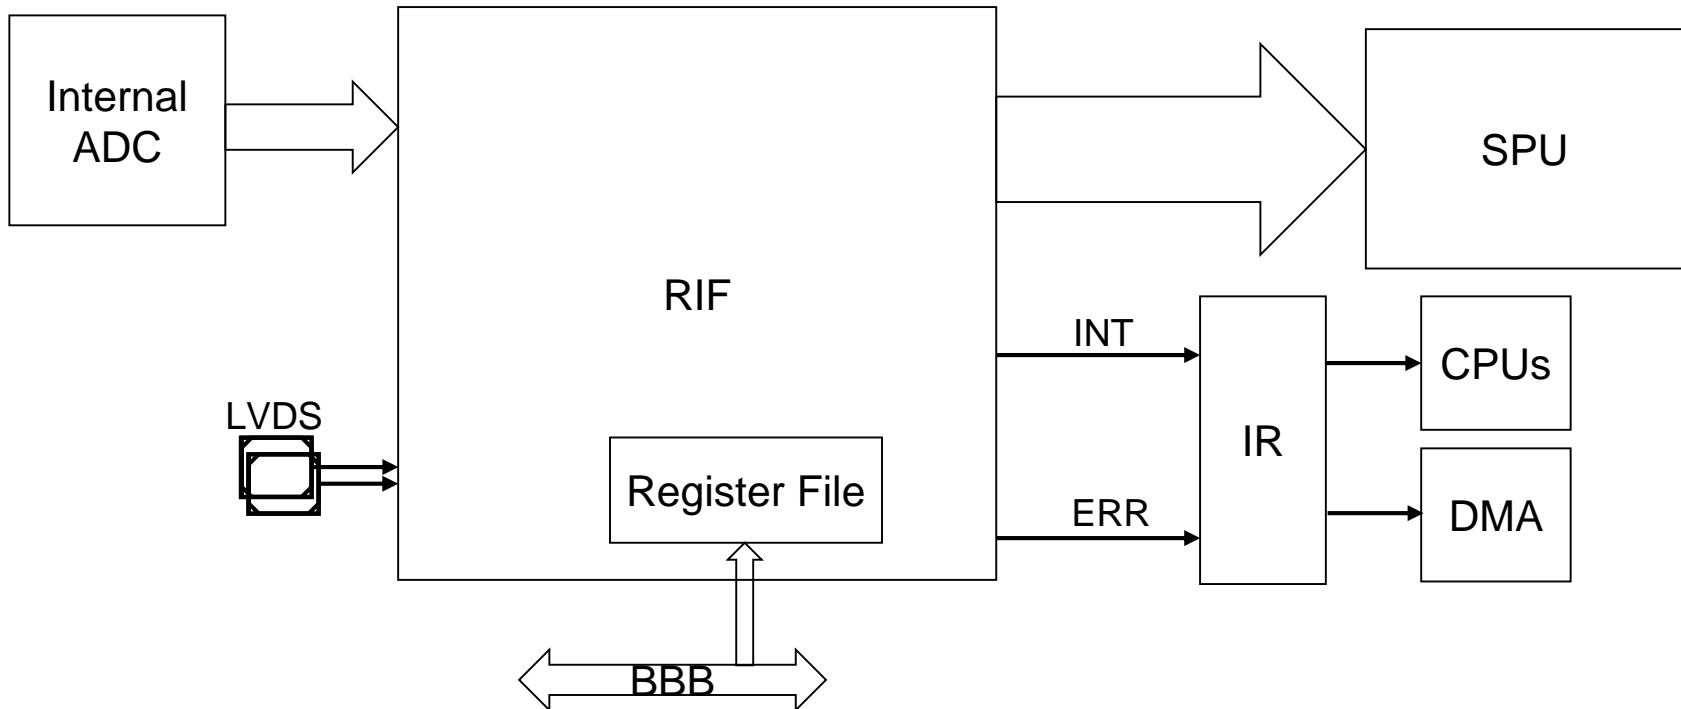

- › In order to enable up to ASIL-B safety requirements, the RIF implements several safety features:
 - For external ADC: the possibility to add a CRC check at the end of every ramp
 - Safety critical configuration register can be CRC checked
 - CRC check can be added to the output data of the RIF in order to assert safe communication with the SPU
 - Partial Lockstep: certain safety critical sub-blocks are duplicated to create redundancy. If enabled, an alarm can be raised in case of mismatch

RIF

System integration

- › The RIF is connected to the internal ADC, the LVDS pad and the SPU in order to enable ADC data transfers
- › The RIF is capable of communicating events and errors to the application via several Interrupt and Error lines through the Interrupt router

Application example

Radar frame reception

- › In this example, the RIF is programmed to receive a frame from 4 channels

1. Receiving a complete frame from 4 channels
2. Signaling a frame is ready to be transmitted
3. Transmit the formatted frame in 32bit packets to the SPU
