## Description

The BGSA147ML10 is a Single-Pole Four Throws (SP4T) Antenna Tuning switch optimized for RF applications up to 7.125 GHz. Its MIPI RFFE digital control interface allows easy implementation and best flexibility when operated in cellular mobile RF Front-End designs.

The BGSA147ML10 is made of 4 ultra-low On resistance / low Off capacitance series switches and 4 shunt to ground switches enabling on-demand open-reflective or short-reflective OFF ports behaviour. This last feature is of great value to reduce antenna engineer development time in case of unwanted antenna resonance or to improve antenna efficiency with less component tuning effort.

Unlike GaAs RF switches, highly linear RF performance is reached at all signal levels within the operating conditions. High RF voltage ruggedness and individually programmable shunt to ground switches on each RF throw make BGSA147ML10 particularly efficient for switching inductors and capacitors in RF matching and Antenna Tuning circuits.

## 2 Maximum Ratings

**Table 1: Maximum Ratings Table** at  $T_A = 25^\circ\text{C}$ , unless otherwise specified

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Frequency Range	$f$	0.4	–	7.125	GHz	<sup>1)</sup>
RFFE Supply voltage <sup>2)</sup>	$V_{IO}$	-0.3	–	2.2	V	Only for infrequent and short duration time periods
Storage temperature range	$T_{STG}$	-55	–	150	°C	–
RF peak voltage	$V_{RF\_max}$	–	–	50	V	Short term peaks (1 $\mu$ s in 0.1% duty cycle), exceeding typical linearity, Ron and Coff parameters, in Isolation mode, test condition schematic in Fig. 1
ESD robustness, CDM <sup>3)</sup>	$V_{ESDCDM}$	-1	–	+1	kV	
ESD robustness, HBM <sup>4)</sup>	$V_{ESDHBM}$	-2	–	+2	kV	
Junction temperature	$T_j$	–	–	125	°C	–
Thermal resistance junction - soldering point	$R_{thJS}$	–	–	80	K/W	–
Maximum DC-voltage on RF-Ports and RF-Ground	$V_{RFDC}$	0	–	0	V	No DC voltages allowed on RF-Ports
RFFE Control Voltage Levels	$V_{SCLK}$ , $V_{SDATA}$ , $V_{USID\_SEL}$	-0.7	–	$V_{IO}+0.7$ (max. 2.2)	V	–

<sup>1)</sup> Switch has a low-pass response. For higher frequencies, losses have to be considered for their impact on thermal heating. The DC voltage at RF ports  $V_{RFDC}$  has to be 0V.

<sup>2)</sup> Note: Consider any ripple voltages on top of  $V_{IO}$ . A high RF ripple at the  $V_{IO}$  can exceed the maximum ratings by  $V_{IO} = V_{DC} + V_{Ripple}$ .

<sup>3)</sup> Field-Induced Charged-Device Model ANSI/ESDA/JEDEC JS-002. Simulates charging/discharging events that occur in production equipment and processes. Potential for CDM ESD events occurs whenever there is metal-to-metal contact in manufacturing.

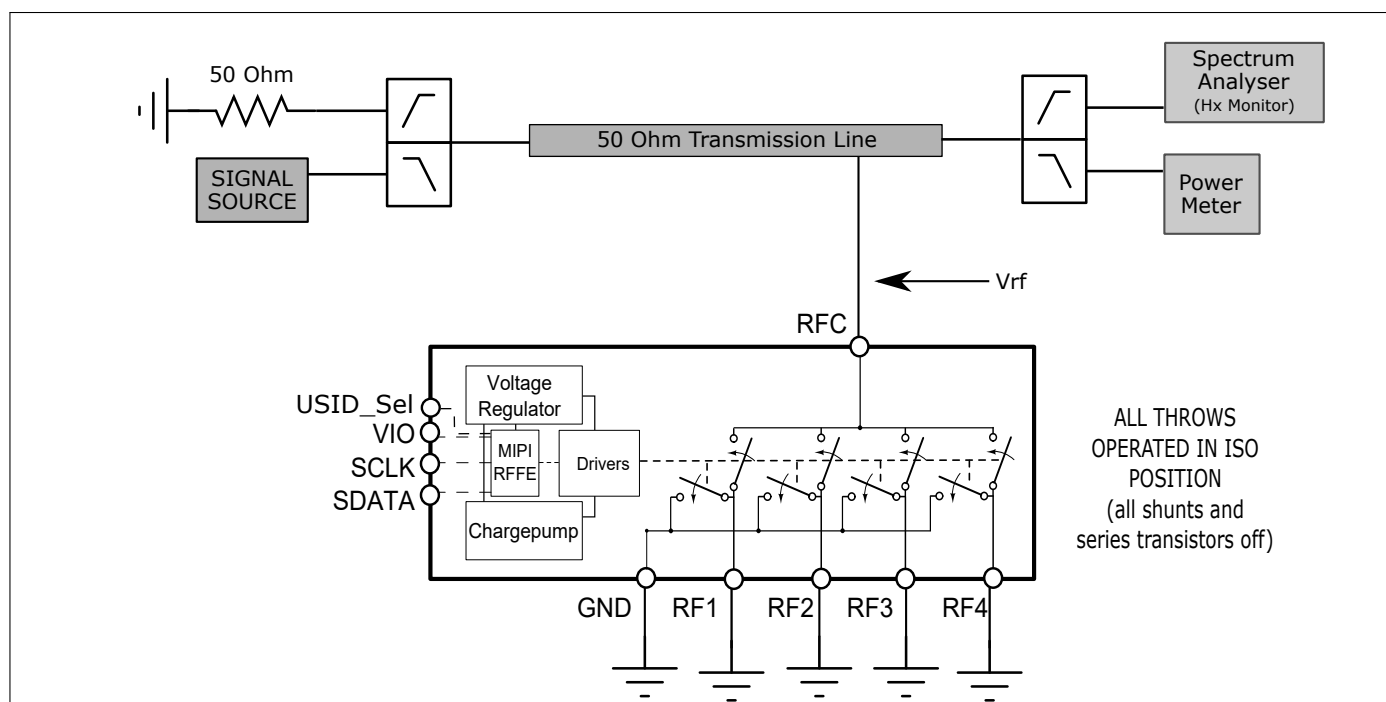

<sup>4)</sup> Human Body Model ANSI/ESDA/JEDEC JS-001 (R=1,5 k $\Omega$ , C=100 pF).

**Warning: Stresses above the max. values listed here may cause permanent damage to the device. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit. Exposure to conditions at or below absolute maximum rating but above the specified maximum operation conditions may affect device reliability and life time. Functionality of the device might not be given under these conditions.**

**Warning:** Register\_0 and Register\_1 RF switch control bits are identical. Writing both Registers Register\_0 and Register\_1 simultaneously will lead to undefined behavior. The unused register (Register\_0 or Register\_1) must remain 0x00.

**BGSA147ML10 truth table allows to connect any combination of above bits in one single write to register\_0 (respectively register\_1) command. As an example RF1 series can be set ON while RF1 shunt is set OFF, RF2, RF3 and RF4 series set OFF and shunt set ON by using this single write to register\_0 command «0b:11100001».**
