

USB Billboard controller

Features

- USB 2.0-certified, Full-speed (12 Mbps)
 - Supports native Billboard Device Class Driver
 - Integrated USB termination resistors
- CY7C65210/210A: Single-channel I²C interface
 - Master up to 400 kHz
 - 190 bytes for each transmit and receive buffer
- CY7C65217/217A: Dual-channel UART/I²C interface
 - UART interface
 - Supports 2-pin
 - Data rates up to 115200 bps
 - 190 bytes for each transmit and receive buffer
 - Data format: 7 or 8 data bits, 1 or 2 stop bits
 - No parity, even, odd, mark, or space parity
 - Supports parity, overrun, and framing errors
 - Supports single-channel RS-232 and RS-422 interface
 - I²C interface
 - Master up to 400 kHz
 - 190 bytes for each transmit and receive buffer
- General-purpose input/output (GPIO) pins:
 - CY7C65210: 9
 - CY7C65217: 7
 - CY7C65210A: 11
 - CY7C65217A: 9
- 2560 bytes flash for storing configuration parameters
- Billboard Device Class-specific descriptors
- Driver support for Billboard device
 - Billboard Device Class is natively supported by Windows 10
- Clocking: Integrated 48-MHz clock oscillator
- Supports bus- or self-powered configurations
- USB Suspend mode for low power
- Operating voltage: 1.71 V to 5.5 V
- Operating temperature:
 - Commercial: 0°C to 70°C
 - Industrial: -40°C to 85°C
 - Automotive: -40°C to 105°C
- ESD protection: 2.2 kV HBM
- RoHS-compliant package
 - 24-lead QFN (4.0 mm × 4.0 mm, 0.55 mm, 0.5-mm pitch)

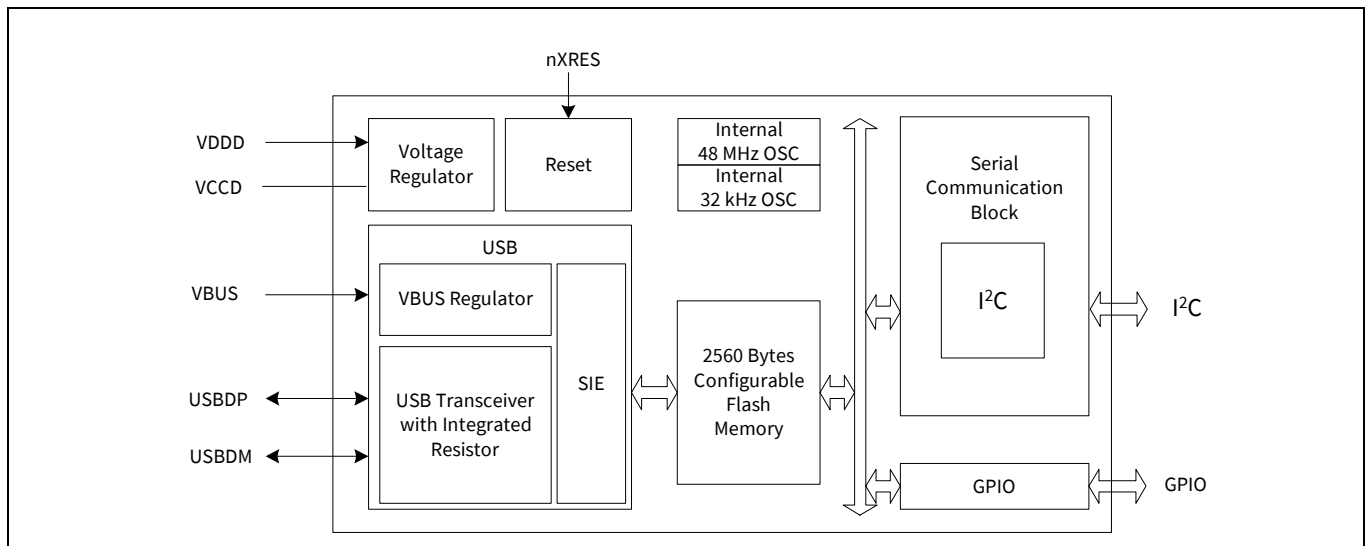

Applications

Applications

Any Type-C Device Container that supports Alternate Mode requires Billboard device support such as:

- Dongles for Type-C
- Docking stations
- Monitors
- Automotive

1 Functional description

CY7C6521x^[1] is a Full-speed USB controller, which enumerates as a Billboard device. It integrates a voltage regulator, an oscillator, and flash memory for storing configuration parameters, offering a cost-effective solution. CY7C6521x supports bus-powered mode and enables efficient system power management with suspend and remote wake-up signals. It is available in a 24-pin QFN package.

5 Functional overview

5.1 USB and Billboard device functionality

5.1.1 USB

CY7C6521x has a built-in USB 2.0 Full-Speed transceiver. The transceiver incorporates the internal USB series termination resistors on the USB data lines and a 1.5 k Ω pull-up resistor on USBDP.

5.1.2 Billboard device functionality

CY7C6521x is used to communicate Alternate Modes supported by a Device Container to a USB Host system. CY7C6521x sends this information through BOS descriptor and string descriptors in human-readable format. CY7C6521x supports the Billboard descriptor as part of the complete BOS descriptor. The CY7C65210/65217 supports USB Billboard Device class Rev. 1.1 while the CY7C65210A/65217A supports USB Billboard Device class Rev. 1.21. For further details on the device class, refer to the [USB Billboard Device Class specification](#).

5.2 Serial communication

CY7C65210 and CY7C65210A have one Serial Communication Block (SCB) whereas CY7C65217 and CY7C65217A have two SCBs that implement either UART or I²C interface.

5.2.1 I²C interface

The I²C interface implements full multi-master mode and supports up to 400 kHz. For further details on the protocol, refer to the NXP I²C specification, Rev. 5.

Notes:

- I²C ports are not tolerant to higher voltages. Therefore, they cannot be hot-swapped or powered up independently when chip is not powered.
- The minimum fall time of the SCL is met (as per NXP I²C specification rev. 5) when V_{DD} is between 1.71 V and 3.0 V. When V_{DD} is within the range of 3.0 V to 3.6 V, it is recommended to add a 50 pF capacitor on the SCL signal.

5.3 UART interface

Only the SCB1 interface of CY7C65217 and CY7C65217A can be configured as a UART interface.

The 2-pin UART interface (RXD and TXD) provides asynchronous serial communication with other UART devices operating at speeds of up to 115200. It supports seven or eight data bits, one or two stop bits, odd, even, mark, space, and no parity. The UART interface supports full-duplex communication with a signaling format that is compatible with the standard UART protocol. The UART pins may be interfaced to industry-standard RS-232/RS-422 transceivers to manage different voltage levels. Common UART functions, such as parity error^[5] and frame error^[6], are supported. The UART parameters can be set using native APIs.

Notes

5. Parity error gets detected when UART transmitter device is configured for odd parity and UART receiver device is configured for even parity.
6. Frame error gets detected when UART transmitter device is configured for 7 bits data width and 1 stop bit, whereas UART receiver device is configured for 8 bit data width and 2 stop bits.

5.4 GPIO interface

CY7C65210 has nine configurable GPIOs whereas CY7C65217 has seven configurable GPIOs. CY7C65210A has eleven configurable GPIOs whereas CY7C65217A has nine configurable GPIOs.

The configurable options are as follows:

- INPUT: Input GPIO
- POWER#: Power control
- TRISTATE: I/O tristated
- OUTPUT: Drive LOW or HIGH

5.5 Memory

CY7C6521x has a 2560 bytes configurable flash. Flash is used to store USB parameters such as VID/PID, serial number, product and manufacturer descriptors, and Billboard Device Class-specific descriptors.

5.6 System resources

5.6.1 Power system

CY7C6521x supports USB Suspend mode to control power usage. CY7C6521x operates in bus-powered or self-powered modes over a range of 3.15 V to 5.5 V.

5.6.2 Clock system

CY7C6521x has a fully integrated clock with no external components required. The clock system is responsible for providing clocks to all subsystems.

5.6.3 Internal 48 MHz oscillator

The internal 48-MHz oscillator is the primary source of internal clocking in CY7C6521x.

5.6.4 Internal 32 kHz oscillator

The internal 32-kHz oscillator is primarily used to generate clocks for peripheral operation in USB Suspend mode.

5.6.5 Reset

The reset block provides reliable power-on reset and brings the device back to the default known state. The nXRES (active LOW) pin can be used by the external devices to reset CY7C6521x.

5.7 Suspend and Resume

The CY7C65210 and CY7C65217 device asserts the SUSPEND pin when the USB bus enters the suspend state. This helps in meeting the stringent suspend current requirement of the USB 2.0 specification, while using the device in bus-powered mode. The device resumes from the suspend state under either of the two following conditions:

- Any activity is detected on the USB bus
- The WAKEUP pin is asserted to generate remote wakeup to the host

5.8 Wakeup

The WAKEUP pin on CY7C65210 and CY7C65217 is used to generate the remote wakeup signal on the USB bus. The remote wakeup signal is sent only if the host enables this feature through the SET_FEATURE request. The device communicates support for the remote wakeup to the host through the configuration descriptor during the USB enumeration process.

5.9 Internal flash configuration

The internal flash memory can be used to store the configuration parameters provided in [Table 5](#).

Revision history

Document revision	Date	Description of changes
**	2015-04-10	New data sheet.
*A	2015-07-22	<p>Updated Features: Replaced 10 with 9 under “General-purpose input/output (GPIO) pins”. Replaced “1536 bytes flash for storing configuration parameters” with “2560 bytes flash for storing configuration parameters”. Updated “Pin Description – CY7C65210”: Updated details corresponding to pins 18, 19, 21 and 22. Updated Functional overview: Updated GPIO interface: Updated description. Updated Memory: Updated description. Updated Internal flash configuration: Updated Table 5: Updated details corresponding to Serial string, and Remote wakeup parameters under “USB Configuration”. Removed GPIO_0 parameter and its details under “GPIO Configuration”. Updated details corresponding to iAdditionalInfoURL, and iAlternateModeString parameters under “Billboard Device class Descriptor Configuration”. Updated Packaging information: spec 001-13937 – Changed revision from *E to *F.</p>
*B	2015-08-13	<p>Updated Document Title to read as “CY7C65210/CY7C65217, USB Billboard Controller”. Added CY7C65217 part related information in all instances across the document. Replaced CY7C65210 with CY7C6521x in the required instances across the document. Updated Features: Updated details under “I²C interface”. Updated Functional description: Added Note 1 and referred the same note in CY7C6521x. Added “Block Diagram – CY7C65217”. Added “Pin Description – CY7C65217”. Updated Functional overview: Added UART interface. Updated Internal flash configuration: Updated Table 5: Updated details corresponding to GPIO_3, and GPIO_4 parameters under “GPIO Configuration”. Added Table 6. Updated Serial communication: Updated description. Updated GPIO interface: Updated description. Updated Application schematic: Added Figure 3. Updated Ordering information: Updated part numbers.</p>

Revision history

Document revision	Date	Description of changes
*C	2016-06-16	Updated Features : Updated details under “Driver support for Billboard Device”. Updated “Pin Description – CY7C65217”: No changes in detail. Removed all existing shades. Updated GPIO configuration : Added “TRISTATE” and “OUTPUT” options. Updated Functional overview : Updated USB and Billboard device functionality : Updated Billboard device functionality : Updated description. Updated UART interface : Added Note 5 and referred the same note in “parity error”. Added Note 6 and referred the same note in “frame error”. Updated GPIO interface : Updated description. Updated Internal flash configuration : Updated Table 6 : Updated details corresponding to GPIO_8 and GPIO_9 parameters under “GPIO Configuration”. Updated Electrical specifications : Added UART specifications . Updated Application schematic : Updated Figure 3 .
