

# TLE4959-5U-SP Transmission Speed Sensor

## Features

- Hall based differential speed sensor
- High magnetic sensitivity
- Large operating airgap
- Dynamic self-calibration principle
- Adaptive hysteresis
- High vibration suppression capabilities
- Three wire voltage interface
- Magnetic encoder and ferromagnetic wheel application
- High immunity against ESD, EMC and mechanical stress, improved voltage dropout capability
- Automotive operating temperature range
- 4-pin package PG-SSO-4-1
- Green Product (RoHS compliant)
- AEC Qualified

## Applications

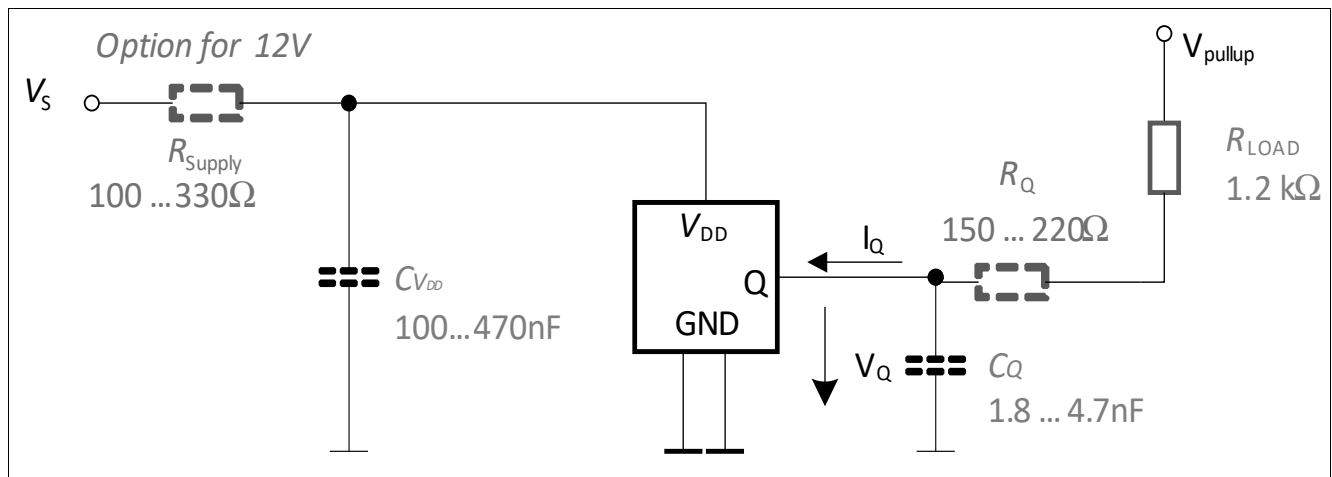

The TLE4959-5U-SP is an integrated differential Hall speed sensor ideally suited for transmission applications. Its basic function is to provide information about rotational speed and direction of rotation to the transmission control unit. TLE4959-5U-SP includes a sophisticated algorithm which actively suppresses vibration while keeping excellent airgap performance.

**Table 1** Description

Type	Marking	Ordering Code	Package
TLE4959-5U-SP	59AY2A	SP004842810	PG-SSO-4-1

## Description

The TLE4959-5U-SP comes in a RoHS compliant four-pin package, qualified for automotive usage. The recommended capacitors increase the EMC robustness of the device. In 12V applications it is further recommended to use a serial resistor  $R_{Supply}$  for protection on the supply line. A pull-up resistor  $R_{Load}$  is mandatory on the output pin and determines the maximum current flowing through the output transistor. A value of 1.2 k $\Omega$  is recommended for the 5V application. (see [Figure 1](#))

**Figure 1** Typical Application Circuit

Functional Description

# 1 Functional Description

The differential Hall sensor IC detects the motion of tooth and magnet encoder applications. To detect the motion of ferromagnetic objects, the magnetic field must be provided by a back biasing permanent magnet. Either south or north pole of the magnet can be attached to the rear unmarked side of the IC package (See [Figure 2](#)). The magnetic measurement is based on three equally spaced Hall elements, integrated on the IC. Both magnetic and mechanical offsets are cancelled by a self calibration algorithm.

## 1.1 Definition of the Magnetic Field Direction

The magnetic field of a permanent magnet exits from the north pole and enters the south pole. If a north pole is attached to the backside of the High End Transmission Sensor, the field at the sensor position is positive, as shown in [Figure 2](#).

Figure 2 Definition of the Positive Magnetic Field Direction

## 1.2 Block Diagram

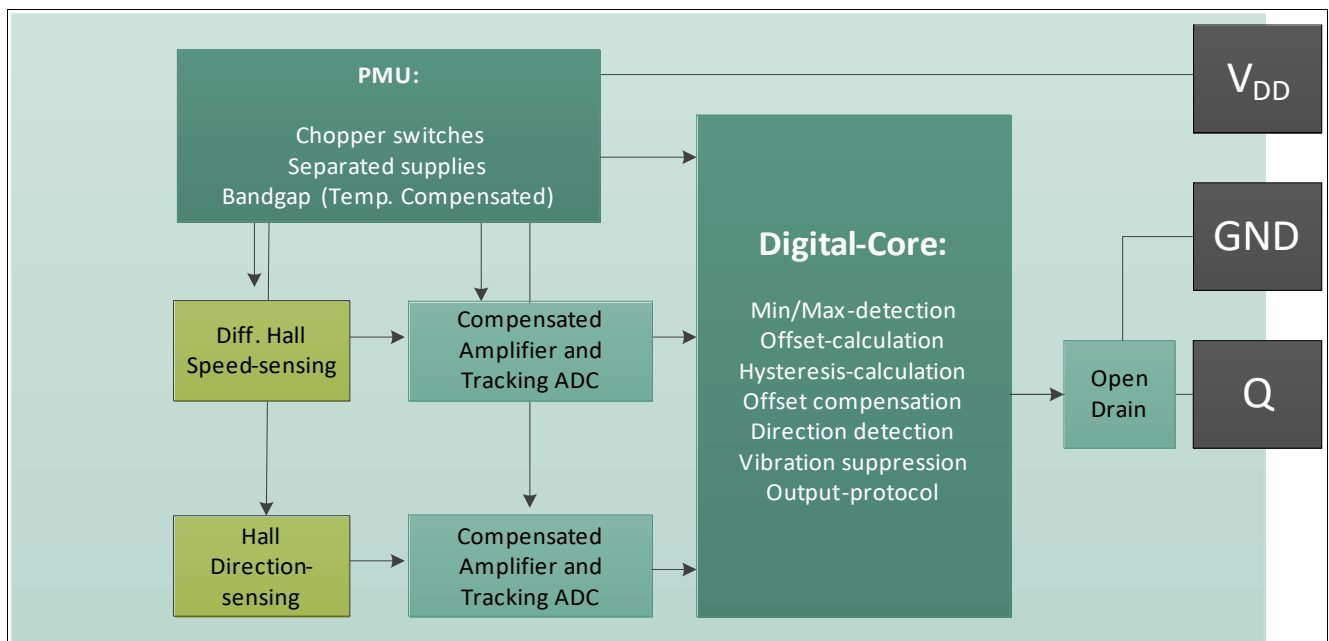

Figure 3 Block Diagram

**Functional Description**

**1.3 Basic Operation**

The speed signal calculated out of the differential hall elements, is amplified, filtered and digitized. An algorithm in the digital core for peak detection and offset calculation will be executed. The offset is fed back into the speed signal path with a digital to analog converter for offset correction. During uncalibrated mode, the output of the speed pulse is triggered in the digital core by exceeding a certain threshold of the tracking ADC. In calibrated mode the output is triggered by the visible hysteresis.

The direction signal is calculated out of center Hall signals. The direction signal is amplified, filtered, and digitized. In the digital core the direction and the vibration detection information is determined and the output protocol is issued.

**1.4 Uncalibrated and Calibrated Mode**

After power on the differential magnetic speed signal is tracked by an analog to digital converter (Tracking ADC) and monitored within the digital core. If the signal slope is identified as a rising edge or falling edge, the first output pulse is triggered. A second trigger pulse is issued with direction information.

In uncalibrated mode, the output protocols are triggered by the DNC (detection noise constant) in the speed path. After start up the sensor switches with the DNC min value and after that the DNC is adapted to the magnetic input signal amplitude.

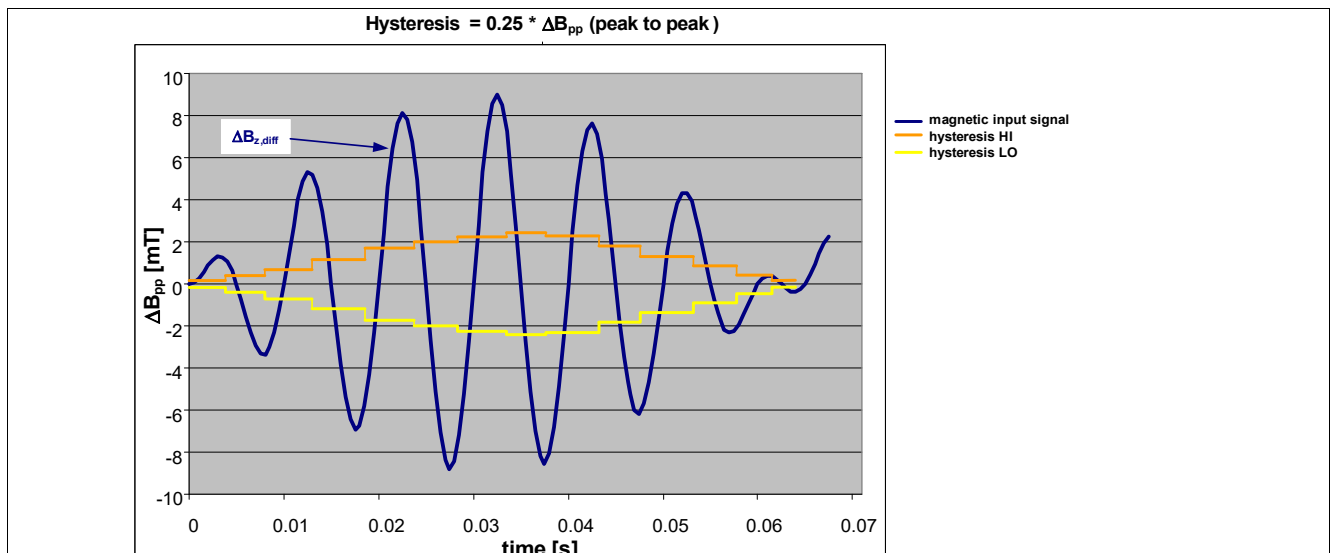

The offset update starts if two valid extrema values are found and the direction of the update has the same orientation as the magnetic signal. For example, a positive offset update is being issued on a rising magnetic edge only. After a successful offset correction, the sensor is in calibrated mode. Switching occurs at the adaptive hysteresis threshold level.

In calibrated mode, the DNC is adapted to magnetic input signal amplitude with a minimum of  $\Delta B_{limit}$ . The output pulses are then triggered with adaptive hysteresis.

**1.5 Hysteresis Concept**

The adaptive hysteresis is linked to the input signal. Therefore, the system is able to suppress switching if vibration or noise signals are smaller than the adaptive hysteresis levels. The typical value for the hysteresis level is 1/4 of the magnetic input signal amplitude, the minimum hysteresis level is  $\Delta B_{limit}$ .

The visible hysteresis keeps the excellent performance in large pitch transmission application wheels.

**Figure 4 Adaptive Hysteresis**

---

## Functional Description

### 1.6 Vibration Suppression

The direction signal is digitized by an analog to digital converter (direction ADC) and fed into the digital core. Depending upon the rotation direction of the target wheel, the signal of the center probe anticipates or lags behind for 90°. This phase relationship is evaluated and converted into rotation direction information by sampling the signal of the center probe in the proximity of the zero crossing of the “speed” bridge signal. The first pulse after power has a different length to signalize that there is no direction information available. The magnetic signal amplitude and the direction information are used for detection of parasitic magnetic signals. Unwanted magnetic signal can be caused by angular or air gap vibrations. If an input signal is identified as a vibration the output pulse will be suppressed.

## General Characteristics

## 2 General Characteristics

### 2.1 Absolute Maximum Ratings

**Table 2 Absolute Maximum Ratings**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Supply voltage without supply resistor	$V_{DD}$	-16	–	18	V	continuous, $T_J \leq 175^\circ\text{C}$
				27	V	max. 60 s, $T_J \leq 175^\circ\text{C}$
		-18			V	max. 60 s, $T_J \leq 175^\circ\text{C}$
Output OFF voltage	$V_{Q\_OFF}$	-1.0	–		V	max. 1 h, $T_{Amb} \leq 40^\circ\text{C}$
		-0.3	–	26.5	V	continuous, $T_J \leq 175^\circ\text{C}$
Output ON voltage	$V_{Q\_ON}$	–	–	16	V	continuous, $T_{Amb} \leq 40^\circ\text{C}$
		–	–	18	V	max. 1 h, $T_{Amb} \leq 40^\circ\text{C}$
		–	–	26.5	V	max. 60 s, $T_{Amb} \leq 40^\circ\text{C}$
Junction temperature range	$T_J$	-40	–	185	$^\circ\text{C}$	exposure time: max. $10 \times 1$ h, $V_{DD} = 16\text{V}$
Magnetic field induction	$B_Z$	-5	–	5	T	magnetic pulse during magnet magnetization. Valid 10 s with $T_{ambient} \leq 80^\circ\text{C}$
ESD compliance	$ESD_{HBM}$	-2	–	2	kV	HBM <sup>1)</sup>

1) ESD susceptibility, HBM according to EIA/JESD 22-A114B

**Note:** Stresses above the max values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

General Characteristics

2.2 Operating Range

All parameters specified in the following sections refer to these operating conditions unless otherwise specified.

Table 3 General Operating Conditions

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Supply voltage without supply resistance $R_s$	$V_{DD}$	4.0	-	16	V	
Continuous Output Off voltage	$V_{Q\_OFF}$	-	-	16	V	
Supply voltage power- up/down voltage ramp	$dV_{DD}/dt$	3.0	-	1e4	V/ms	
Supply current	$I_{DD}$	8.0	-	13.4	mA	
Continuous output On current	$I_{Q\_ON}$		-	15	mA	$V_{Q\_LOW} < 0.5 V$
Magnetic signal frequency range	$f$	0	-	10	kHz	
Dynamic range of the magnetic field of the differential speed channel	$DR_{mag\_field\_s}$	-120	-	120	mT	
Dynamic range of the magnetic field of the direction channel	$DR_{mag\_field\_dir}$	-60	-	60	mT	
Static range of the magnetic field of the outer Hall probes	$SR_{mag\_field\_s}$	0	-	550	mT	
Static range of the magnetic field of the center Hall probe	$DR_{mag\_field\_dir}$	-100	-	450	mT	
Allowed static difference between outer probes	$SR_{mag\_field\_diff}$	-30	-	30	mT	
Normal operating junction temperature	$T_J$	-40	-	175	°C	exposure time: max. 2500 h at $T_J = 175^\circ C$ , $V_{DD} = 16 V$
		-	-	185	°C	exposure time: max. $10 \times 1 h$ at $T_J = 185^\circ C$ , $V_{DD} = 16 V$ , additive to other lifetime
Not operational lifetime	$T_{no}$	-40		150	°C	without sensor function; exposure time max 500 h @ $150^\circ C$ ; increased time for lower temperatures according to Arrhenius-Model, additive to other lifetime
Temperature compensation range of magnetic material	$TC$		-800		ppm	internal compensation of magnetic signal amplitude of speed signal

Note: In the operating range the functions given in the functional description are fulfilled

## Electrical and Magnetic Characteristics

### 3 Electrical and Magnetic Characteristics

All values specified at constant amplitude and offset of input signal, over operating range, unless otherwise specified. Typical values correspond to  $V_S = 5\text{ V}$  and  $T_{\text{Amb.}} = 25^\circ\text{C}$

**Table 4 Electrical and Magnetic Parameters**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Output saturation voltage	$V_{Q\text{sat}}$	0	-	500	mV	$I_Q \leq 15\text{ mA}$
Clamping voltage $V_{DD}$ -Pin	$V_{DD\_clamp}$	42		-	V	leakage current through ESD diode $< 0.5\text{mA}$
Clamping voltage $V_Q$ -Pin	$V_{Qclamp}$	42		-	V	leakage current through ESD diode $< 0.5\text{mA}$
Reset voltage	$V_{DD\_reset}$	2.8		3.6	V	
Output leakage current	$I_{Qleak}$	0	0.1	10	$\mu\text{A}$	$V_Q = 18\text{ V}$
Output current limit during short-circuit condition	$I_{Qshort}$	30	-	80	mA	
Junction temperature limit for output protection	$T_{prot}$	190	-	205	$^\circ\text{C}$	
Power on time	$t_{\text{power\_on}}$	0.8	0.9	1	ms	during this time the output is locked to high.
Delay time between magnetic signal switching point and corresponding output signal falling edge switching event	$t_{\text{delay}}$	10	14	19	$\mu\text{s}$	
Output fall time	$t_{\text{fall}}$	2.0	2.5	3.0	$\mu\text{s}$	$V_{\text{Pullup}} = 5\text{ V}$ , $R_{\text{Pullup}} = 1.2\text{ k}\Omega$ (+/-10%), $C_Q = 1.8\text{ nF}$ (+/-15%), valid between 80% - 20%
		3.2	4.5	5.8	$\mu\text{s}$	$V_{\text{Pullup}} = 5\text{ V}$ , $R_{\text{Pullup}} = 1.2\text{ k}\Omega$ (+/-10%), $C_Q = 1.8\text{ nF}$ (+/-15%), valid between 90% - 10%
Output rise time	$t_{\text{rise}}^{1)}$	4	-	11.4	$\mu\text{s}$	$R_{\text{Pullup}} = 1.2\text{ k}\Omega$ (+/-10%), $C_Q = 1.8\text{ nF}$ (+/-15%), valid between 10% - 90%
Digital noise constant of speed channel during start up	$DNC_{\text{min}}$	1.22	1.5	1.78	mT	
Duty Cycle in calibrated mode <sup>2)</sup>	$Dty$	40		60	%	on sinusoidal signals
Period Jitter, $f \leq 8\text{ kHz}^3)$	$Jit_{8\text{kHz}}$	-1	-	1	%	1 sigma, $\Delta B_{\text{pkpk}} = 3\text{mT}$
Period Jitter, $8\text{ kHz} \leq f \leq 10\text{ kHz}^3)$	$Jit_{10\text{kHz}}$	-1.1		1.1	%	1 sigma, $\Delta B_{\text{pkpk}} = 3\text{mT}$
Number of wrong pulses at start-up	$n_{\text{Start}}$	-	-	0	n	in forward rotational direction
		0	-	1	n	in backward rotational direction

Electrical and Magnetic Characteristics

**Table 4 Electrical and Magnetic Parameters (cont'd)**

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Global run out <sup>4)</sup>	$Runout_{global, speed}$	0	–	40	%	of magnetic speed signal amplitude
		0	–	60	%	of magnetic speed signal amplitude with reduced performance on stop-start-functionality
	$Runout_{global, dir}$	0	–	40	%	of magnetic direction signal amplitude
		0	–	60	%	of magnetic direction signal amplitude with reduced performance on stop-start-functionality
Tooth to tooth run out (peak to peak variation on two consecutive teeth / pole-pair) <sup>4)</sup>	$Runout_{tooth, speed}$	0	–	40	%	of magnetic speed signal amplitude
	$Runout_{tooth, dir}$	0	–	40	%	of magnetic direction signal amplitude

- 1) Application parameter, IC shall not increase the rise time, Values are calculated and not tested
- 2) During fast offset alterations, due to the calibration algorithm, exceeding the specified duty cycle is permitted for short time periods. Parameter not subject to production test, verify by design/characterization.
- 3) Parameter not subject to productive test. Verified by lab characterization based on jitter-measurement > 1000 periods
- 4) Defined as  $1 - (amplitude\_min / amplitude\_max)$

**Note:** *The listed Electrical and magnetic characteristics are ensured over the operating range of the integrated circuit. Typical characteristics specify mean values expected over the production spread. If not other specified, typical characteristics apply at  $T_{Amb} = 25^{\circ}C$  and  $V_S = 5 V$ .*

Package Information

### 4 Package Information

Pure tin covering (green lead plating) is used. The product is RoHS (Restriction of Hazardous Substances) compliant and marked with letter G in front of the data code marking and may contain a data matrix code on the rear side of the package (see also information note 136/03). Please refer to your key account team or regional sales if you need further information.

The specification for soldering and welding is defined in the latest revision of application note “Recommendation for Board Assembly-Hallsensor SSO Packages”.
