

OPTIREG™ linear TLS850B0TBV50

Low dropout linear voltage regulator

Features

- Wide input voltage range from 3.0 V to 40 V
- Fixed output voltage 5 V
- Output voltage accuracy $\leq \pm 2\%$
- Output current capability up to 500 mA
- Ultra low current consumption, typical 20 μA
- Very low dropout voltage, typical 100 mV at 100 mA
- Stable with ceramic output capacitor of 1 μF
- Enable function
- Overtemperature shutdown
- Output current limitation
- Wide temperature range
- Green Product (RoHS-compliant)

Potential applications

- Automotive or other supply systems that are connected to the battery permanently
- Automotive supply systems that need to operate in cranking condition

Product validation

Qualified for automotive applications. Product validation according to AEC-Q100.

Description

The OPTIREG™ linear TLS850B0TBV50 is a high performance, very low dropout linear voltage regulator for 5 V supply in a PG-T0263-5 package.

The input voltage range of 3 V to 40 V and a very low quiescent current of 20 μA make it the perfect match for automotive or other supply systems connected to the battery permanently.

The new loop concept combines fast regulation and very high stability. Below an output current of 100 mA, the typical dropout voltage is below 100 mV. The operating range starts at an input voltage of only 3 V (extended operating range). This makes the TLS850B0TBV50 suitable for automotive systems that need to operate during cranking condition.

The device can be switched on and off by the enable feature.

Internal protection features such as output current limitation and overtemperature shutdown protect the device from immediate damage due to failures such as output shorted to GND, overcurrent, and overtemperature.

Choosing external components

An input capacitor C_i is recommended to compensate line influences.

The output capacitor C_o is necessary for the stability of the regulating circuit. TLS850B0TBV50 is designed to operate stable with low-ESR ceramic capacitors.

3.1 Absolute maximum ratings

Table 2 Absolute maximum ratings¹⁾

$T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$; all voltages with respect to ground (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Input I, Enable EN							
Voltage	V_I, V_{EN}	-0.3	-	45	V	-	P_4.1.1
Output Q							
Voltage	V_Q	-0.3	-	7	V	-	P_4.1.2
Temperatures							
Junction temperature	T_j	-40	-	150	°C	-	P_4.1.3
Storage temperature	T_{stg}	-55	-	150	°C	-	P_4.1.4
ESD susceptibility							
ESD susceptibility to GND	V_{ESD}	-2	-	2	kV	²⁾ Human body model (HBM)	P_4.1.5
ESD susceptibility to GND	V_{ESD}	-500	-	500	V	³⁾ Charged device model (CDM)	P_4.1.6
ESD susceptibility of corner pins to GND	$V_{ESD1,5}$	-750	-	750	V	³⁾ Charged device model (CDM)	P_4.1.7

1) Not subject to production test, specified by design.

2) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS001 (1.5 kΩ, 100 pF).

3) ESD susceptibility, charged device model (CDM) according to JEDEC JESD22-C101.

Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent device destruction under fault conditions described in the datasheet. Fault conditions are considered as “outside” normal operating range. Protection functions are not designed for continuous repetitive operation.

General product characteristics

3.2 Functional range

Table 3 Functional range

$T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$; all voltages with respect to ground (unless otherwise specified)

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Input voltage range	V_I	$V_{Q,nom} + V_{dr}$	–	40	V	¹⁾ –	P_4.2.1
Extended input voltage range	$V_{I,ext}$	3.0	–	40	V	²⁾ –	P_4.2.2
Enable voltage range	V_{EN}	0	–	40	V	–	P_4.2.3
Output capacitor's requirements for stability	C_Q	1	–	–	μF	³⁾⁴⁾ –	P_4.2.4
ESR of output capacitor	$ESR(C_Q)$	–	–	50	Ω	³⁾ –	P_4.2.5
ESR of output capacitor	$ESR(C_Q)$	–	–	100	Ω	³⁾ $V_{IN} < 25\text{ V}$	P_4.2.5
Junction temperature	T_j	-40	–	150	$^\circ\text{C}$	–	P_4.2.6

1) Output current is limited internally and depends on the input voltage. See Electrical Characteristics for more details.

2) If $V_{I,ext,min} \leq V_I \leq V_{Q,nom} + V_{dr}$, then $V_Q = V_I - V_{dr}$. If $V_I < V_{I,ext,min}$, then V_Q can drop to 0 V.

3) Not subject to production test, specified by design.

4) The minimum output capacitance requirement is applicable for a worst-case capacitance tolerance of 30%.

Note: Within the functional or operating range, the device operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics table.

General product characteristics

3.3 Thermal resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to www.jedec.org.

Table 4 Thermal resistance ¹⁾

Parameter	Symbol	Values			Unit	Note or Test Condition	Number
		Min.	Typ.	Max.			
Junction to case	R_{thJC}	–	3.2	–	K/W	–	P_4.3.1
Junction to ambient	R_{thJA}	–	21	–	K/W	²⁾ 2s2p board	P_4.3.2

Junction to ambient	R_{thJA}	–	30	–	K/W	³⁾ 1s0p board, 600 mm ² heatsink area on PCB	P_4.3.5

- 1) Not subject to production test, specified by design.
- 2) The specified R_{thJA} value is according to JEDEC JESD51-2,-5,-7 at natural convection on an FR4 2s2p board. The product (chip and package) was simulated on a 76.2 × 114.3 × 1.5 mm³ board with two inner copper layers (2 × 70 μm Cu, 2 × 35 μm Cu). Where applicable, a thermal via array under the exposed pad contacted the first inner copper layer.
- 3) The specified R_{thJA} value is according to JEDEC JESD 51-3 at natural convection on an FR4 1s0p board. The product (chip and package) was simulated on a 76.2 × 114.3 × 1.5 mm³ board with one copper layer (1 × 70 μm Cu).

4 Block description and electrical characteristics

4.1 Voltage regulation

The output voltage V_Q is divided by a resistor network. This fractional voltage is compared to an internal voltage reference and the pass transistor is driven accordingly.

The control loop stability depends on the following factors:

- Output capacitor C_Q
- Load current
- Chip temperature T_j
- Internal circuit design

To ensure stable operation, the output capacitor's capacitance and its equivalent series resistor $ESR(C_Q)$ requirements given in **Table 3** must be maintained. Because the output capacitor must buffer load steps, it must be sized according to the requirements of the application.

An input capacitor C_I is recommended to compensate line influences. In order to block influences such as pulses and high frequency distortion at the input, an additional reverse-polarity protection diode and a combination of several capacitors for filtering should be used. Connect the capacitors close to the component's terminals.

In order to prevent overshoots during start-up, a slope-control function is implemented. This significantly reduces output voltage overshoots during start-up, mostly independent from the load.

If the load current exceeds the specified limit, for example, due to a short circuit, then the device limits the output current, and the output voltage decreases.

The overtemperature shutdown circuit prevents the device from immediate destruction in fault condition, for example, due to a permanent short-circuit at the output, by switching off the power stage. After the chip has cooled down, the regulator restarts. This leads to an oscillatory behavior of the output voltage until the fault is removed. However, any junction temperature above 150°C is outside the maximum ratings and therefore significantly reduces the lifetime of the device.

4.5 Enable function

The TLS850B0TBV50 can be switched on and off by the enable feature. Applying a high level as specified below (for example, battery voltage) to the EN pin enables the device. Applying a low level as specified below (for example, GND) shuts down the device. If a signal with slow slope is applied to the EN pin, the built-in hysteresis of the enable feature avoids toggling between the ON/OFF states.

Table 7 Electrical characteristics: enable function

$T_j = -40^\circ\text{C}$ to $+150^\circ\text{C}$, $V_I = 13.5\text{ V}$, all voltages with respect to ground (unless otherwise specified)

Application information

5 Application information

5.1 Application diagram

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition, or quality of the device.

Figure 5 Application diagram

Note: This is a very simplified example of an application circuit. The function must be verified in the real application.

5.2 Selection of external components

5.2.1 Input pin

Figure 5 shows the typical input circuitry for a linear voltage regulator. A ceramic capacitor at the input, in the range of 100 nF to 470 nF, is recommended to filter the high frequency disturbances imposed by the line, for example, ISO pulses 3a/b. This capacitor must be placed very close to the input pin of the linear voltage regulator on the PCB.

An aluminum electrolytic capacitor in the range of 10 µF to 470 µF is recommended as an input buffer to damp high energy pulses, such as ISO pulse 2a. This capacitor must be placed close to the input pin of the linear voltage regulator.

An overvoltage suppressor diode can be used to further suppress any high voltage beyond the maximum rating of the linear voltage regulator and to protect the device from damage due to overvoltage.

The external components at the input pin are optional, but they are recommended in case of possible external disturbances.

5.2.2 Output pin

An output capacitor is mandatory for the stability of linear voltage regulators.

The requirement to the output capacitor is given in **Table 3**.

Application information

TLS850B0TBV50 is designed to also be stable with low-ESR capacitors. According to the automotive requirements, ceramic capacitors with X5R or X7R dielectrics are recommended.

The output capacitor should be placed as close as possible to the voltage regulator's output pin and GND pin, on the same side of the PCB as the regulator itself.

In case of input voltage transients or load current transients, the capacitance should be dimensioned in accordance, and verified in the real application that the output stability requirements are fulfilled.

5.3 Thermal considerations

The total power dissipation can be calculated from the known input voltage, the output voltage and the load profile of the application:

$$P_D = (V_I - V_Q) \times I_Q + V_I \times I_q \quad (5.1)$$

with

- P_D : continuous power dissipation
- V_I : input voltage
- V_Q : output voltage
- I_Q : output current
- I_q : quiescent current

The maximum acceptable thermal resistance R_{thJA} is:

$$R_{thJA,max} = (T_{j,max} - T_a) / P_D \quad (5.2)$$

with

- $T_{j,max}$: maximum allowed junction temperature
- T_a : ambient temperature

Based on the above calculation, the proper PCB type and the necessary heat sink area can be determined with reference to the specification in [Thermal resistance](#).

5.4 Reverse-polarity protection

TLS850B0TBV50 is not protected against reverse-polarity faults and must be protected by external components against negative supply voltage. An external reverse-polarity diode is necessary. The absolute maximum ratings of the device as specified in [Absolute maximum ratings](#) must be maintained.

5.5 Further application information
